Phase 3

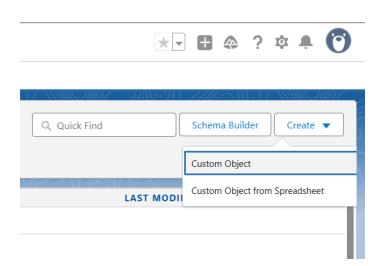

This phase discusses about the Data modelling, Objects, Fields and the Relationships between them

Objects:

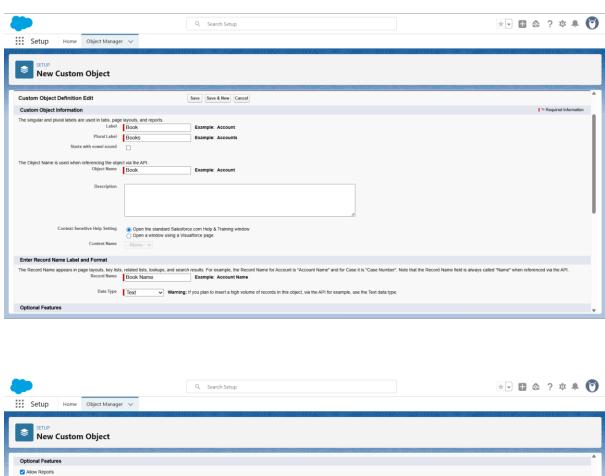

Custom Objects:

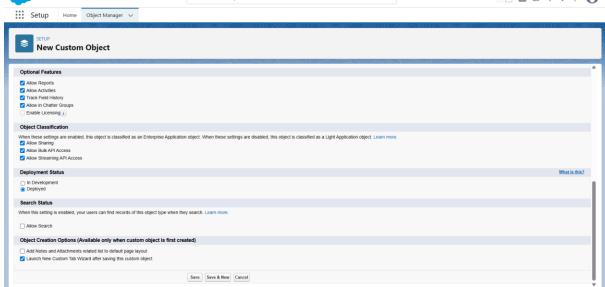

- <u>Book</u>: Will be used to store the information of library books.
- <u>Borrower</u>: This object will be used for maintaining the borrowers list and possible late dues.
- <u>Member</u>: This will maintain the information of the library members.
- <u>Bill</u>: This will maintain the bills for the library member and their payment status.

Creating the objects:

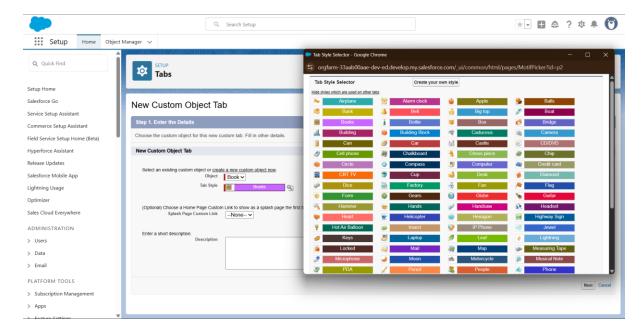

Book:

Creating tab for book:

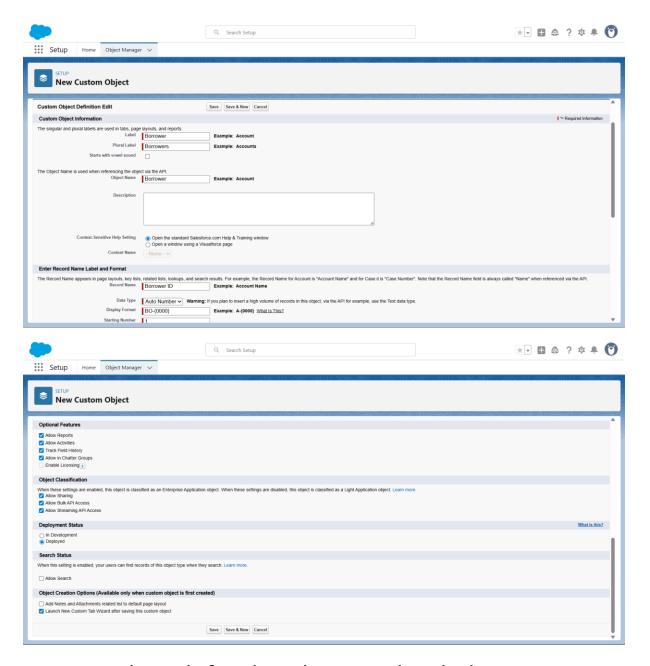

Now disable include tab to all the custom apps and selecting just "Shelf Sync Library" App

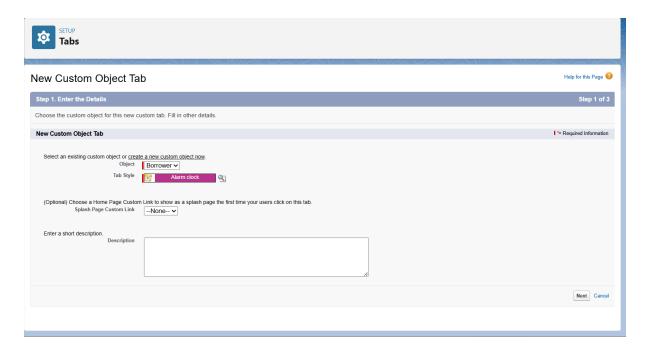

And hitting save.

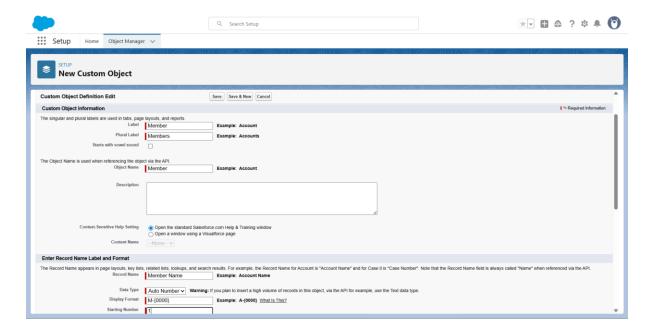

Borrower:

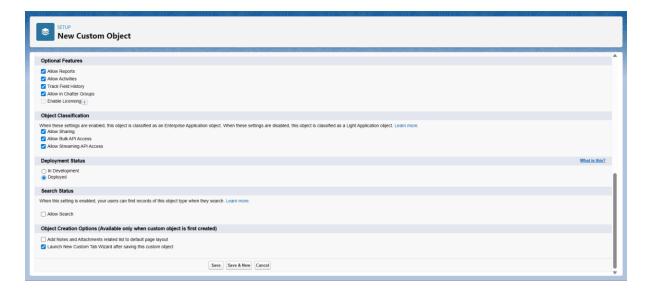

Creating the Tab for this object and including in Library app

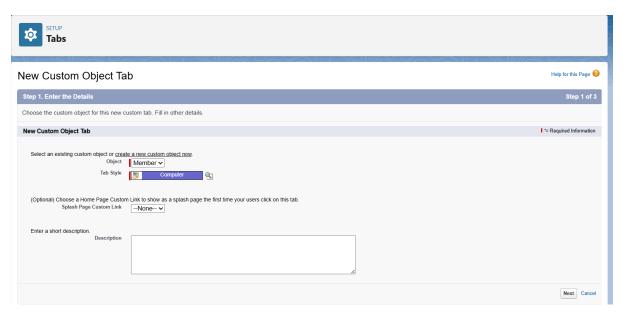

Member:

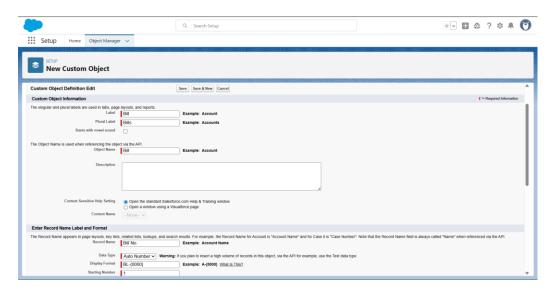

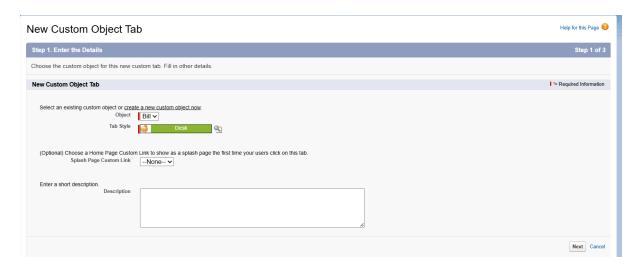

And a Tab for this object:

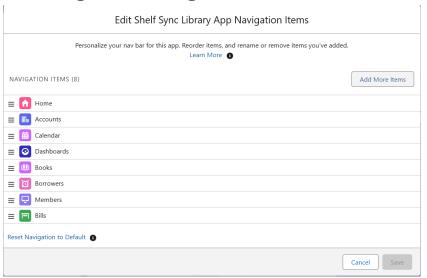

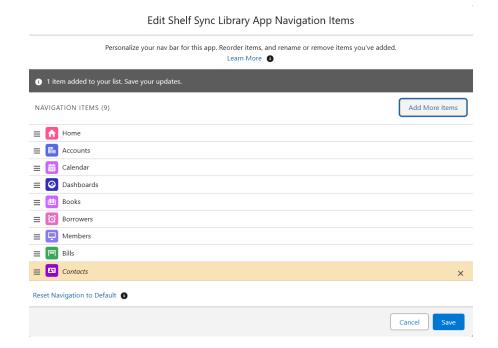

Bill:

❖ Adding the Navigation bar items for the Library :

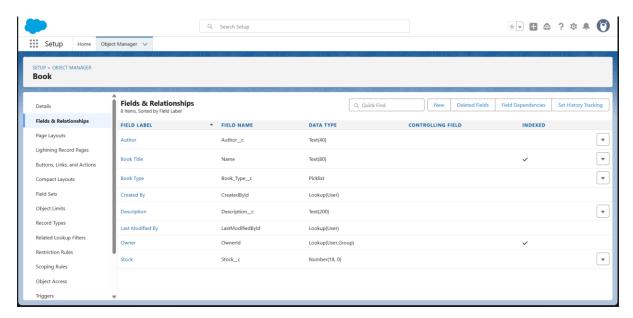

❖ Fields in Objects:

Book :

Creating Fields: Book Name/Title (Text), Author (Text), Book Type (Picklist), Description (Text), Quantity / Stock (Number).

Below is a screenshot:

- We need an book title, author name, book type, stock available and description of the book if needed.
- This Objects Record is a Parent for Borrower's Master
 Detail Relationship.

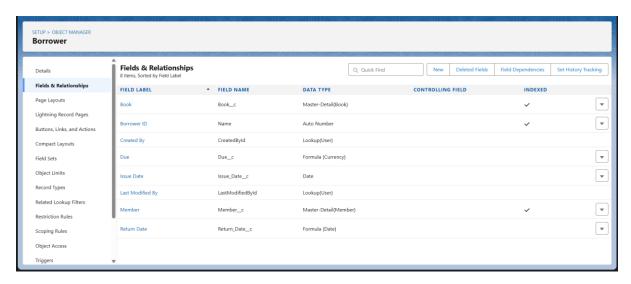

Book Type has List of book types:

Romance, Fantasy, Science Fiction, Mystery & Detective, Thriller & Suspense, Horror, Historical Fiction, Adventure, Memoir & Autobiography, Biography, Self-Help/Personal Development, History, Business & Economics, Science & Technology, Art & Photography.

Borrower:

Creating Fields: Book (Master Detail (Book)), Issue Date (Date), Return Date (Formula(Date)), Member (Master Detail (Member)), Due/Fine (Formula (Currency)), Borrower ID (Auto Number).

Below is a screenshot:

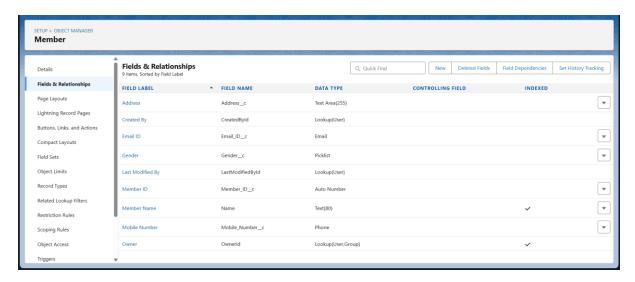

- This Object is a child to its two parents i.e. One is BOOK and Other is MEMBER, and thus has 2 Master Detail Relationships and is the Junction Object here.
- If any of its parent gets deleted the borrower records will be deleted and depends on its parents.
- Return Date is Formulated from the Issue Date :
- Formula is : Issue_Date__c + 30
- To get an return date of 30 days after issuing the book.
- Due is calculated using formula depending on the days passed after the return date, with 50 \$ per day as Fine.

Formula is: IF(TODAY() > Return_Date__c, (TODAY() - Return_Date__c) * 50, 0)

• Member:

Creating Fields: Member Name (Text), Member ID (Auto Number), Email ID (Email), Mobile Number (Phone), Gender (Picklist), Address (Text).

Below is a screenshot:

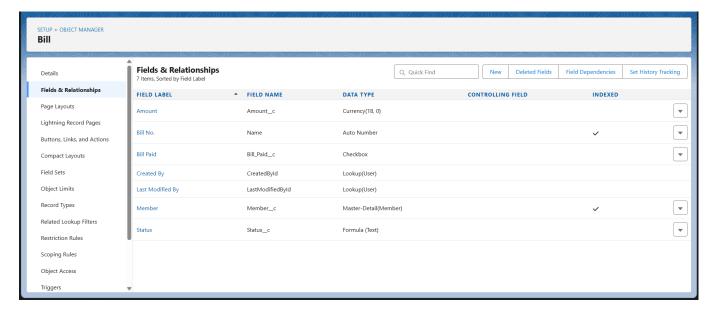

- This Object is one of the parents of the Borrower Object and the parent of Bill Object.
- Deleting this record will cause records of both Borrower and Bill to be deleted according to MD relationship.
- Gender is a Picklist with values: Male, Female and Others.

• Bill:

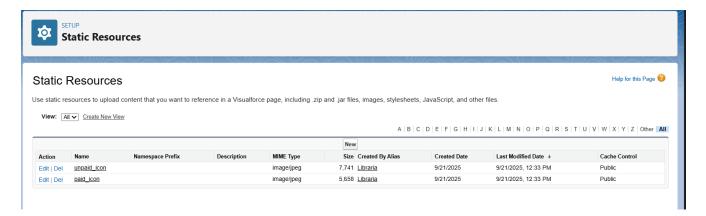

Creating Fields: Bill No., Status (Formulae(Text)), Member Name (Master Detail (Member)), Amount Due (Currency), Bill Paid (Checkbox).

Below is a screenshot:

- This is a child to the Member Object and has one Master Detail Relationship.
- This Object will show us the impending dues of the library members and the records which will be created using automation features of salesforce and triggers.
- The Status Box Shows a Image Output from a formula i.e. if the Bill_Paid is True or False.

The images are imported as **Static Resource** in the org.

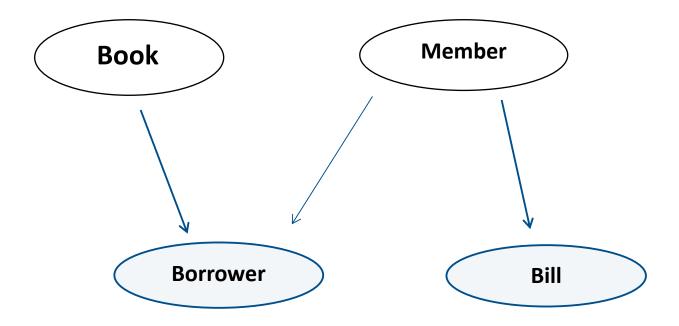

The formula used:

```
IF(
    Bill_Paid__c,
    IMAGE("/resource/paid_icon", "Paid", 100, 100),
    IMAGE("/resource/unpaid_icon", "Unpaid", 100, 100)
)
```

Shows the respective image for bill paid or not paid.

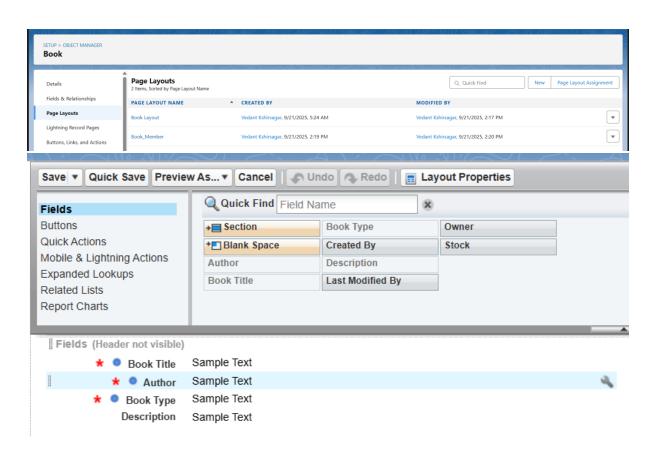

❖The Relationship Diagram :

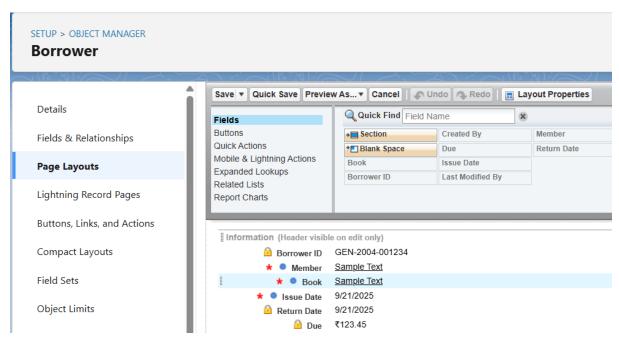

- In the above diagram the Book → Borrower shows a parent to child relation and;
- Member → Borrower, Member → Bill shows another parent to child relation
- Here the Borrower Object has Two Master Detail Relationships
- The Bill Object has One Master Detail Relationship
- The Borrower is a **Junction** Object.

❖ Page Layouts :

Books: (Changing the layout for Members)
 Hiding unnecessary detail

Borrower: (Arranging the Existing One)

• Bill (Change for Members)

Hiding sensitive setting for bill paid option
